## Is there a difference between male and female salaries?

The plaintiff's team would like to prove that wage discrimination has happened in the firm. For this, you should look at the descriptive analysis of the salaries in the two groups.

1. Find the data table **DATA B** with associates who joined the firm in 2012, listing their gender and their last available salary. Find and review the corresponding variable list.
2. Use **OPERATION** cards to select the rows for male and female associates. Put the resulting card aside, you will need them later.
3. You want to compute the average salary of male and female associates. Combine a "select rows" operation and a "summarize salary" to see the results.
4. Share your findings in Court and discuss.
